

# ETOS

EVENT BASED SIMULATION SYSTEM

Powered by python3 and SimPy

Mgr. Jiří Fišer, Ph.D.

Pavel Hronek

Josef Šenfeld

Jiří Škvára

# Presentation outline

- SimPy
  - Pros
  - cons
- ETOS
  - Description
  - Basic Objects
- Sample model
  - Actor, transaction
  - Expected results
  - Sub-models
- Results

# SimPy simulation language

- Object-oriented , process-based discrete event simulation language for Python
- Written in Python
- Latest Release is 2.3
- Comes with data collection capabilities, GUI and plotting packages

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

UNIVERZITA J. E. PURKYNĚ V ÚSTÍ NAD LABEM

# SimPy: pros and cons

- Pros
  - Natural model based on coroutines
  - Support of basic simulation objects and mechanisms
  - Plenty of Python libraries
- Cons
  - Behaviour of simulated object is modeled by single coroutine
  - Complicated declarative parametrization of models

**ETOS**

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

UNIVERZITA J. E. PURKYNĚ V ÚSTÍ NAD LABEM

# ETOS description

- Declarative extension of SimPy
- Models based on mixture of procedural and declarative code
- Procedural
  - Elementary actions
  - Data processing
- Declarative
  - Flow of elementary actions and their parameters, logging, statistics, XML representation

# ETOS main objects

- **E**ntity
  - Basic actions and its states
- **T**ransaction
  - Defined processes
- Shared **O**bjects
  - Shared resources
- Actors
  - Active objects
- **S**imulations
  - Defines simulation time, collects data

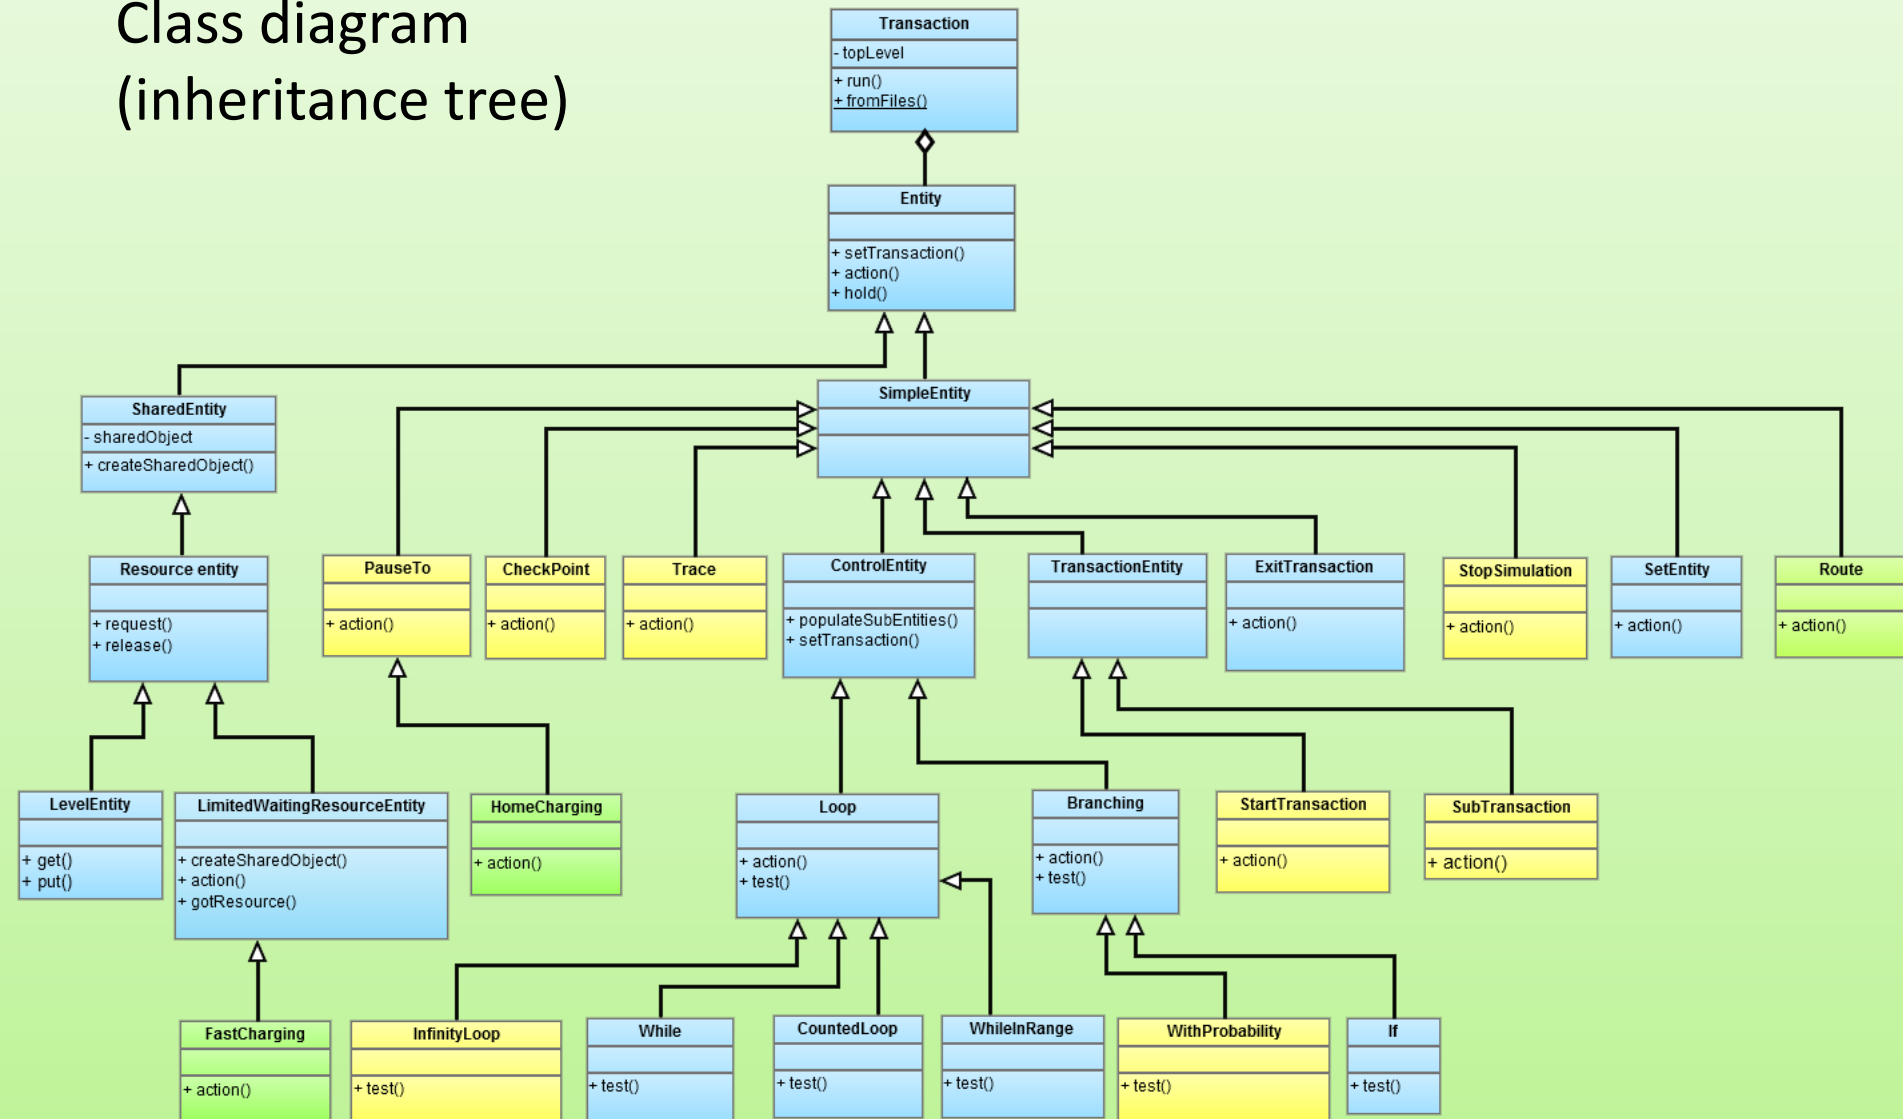

**ETOS**

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

UNIVERZITA J. E. PURKYNĚ V ÚSTÍ NAD LABEM

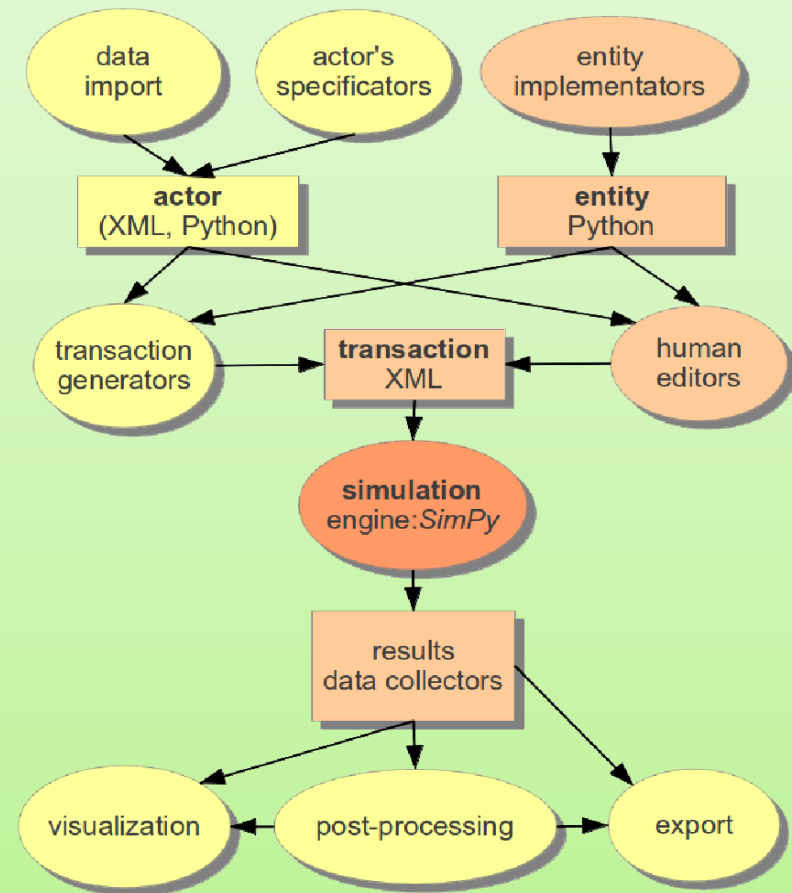

# Class diagram (inheritance tree)

# Main goal of ETOS project

- Separations of roles during design and implementation of simulation model

# Innovative contributions

- Context model
  - Configurable context
- Subtransactions
  - Independent SimPy processes
- Data collectors
  - Collectors with support for counting, basic statistics and logging

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

UNIVERZITA J. E. PURKYNĚ V ÚSTÍ NAD LABEM

# Sample model

- Actor
  - E-car (battery powered)
- Transaction
  - Daily route from home to work and back
  - Sometimes includes route to shopping center
  - Two types of charging (slow,fast)
- Expected results
  - Frequency of out-of-battery events
  - Fast / Slow charging ratio
  - Utilization of fast charging stations
  - Etc.

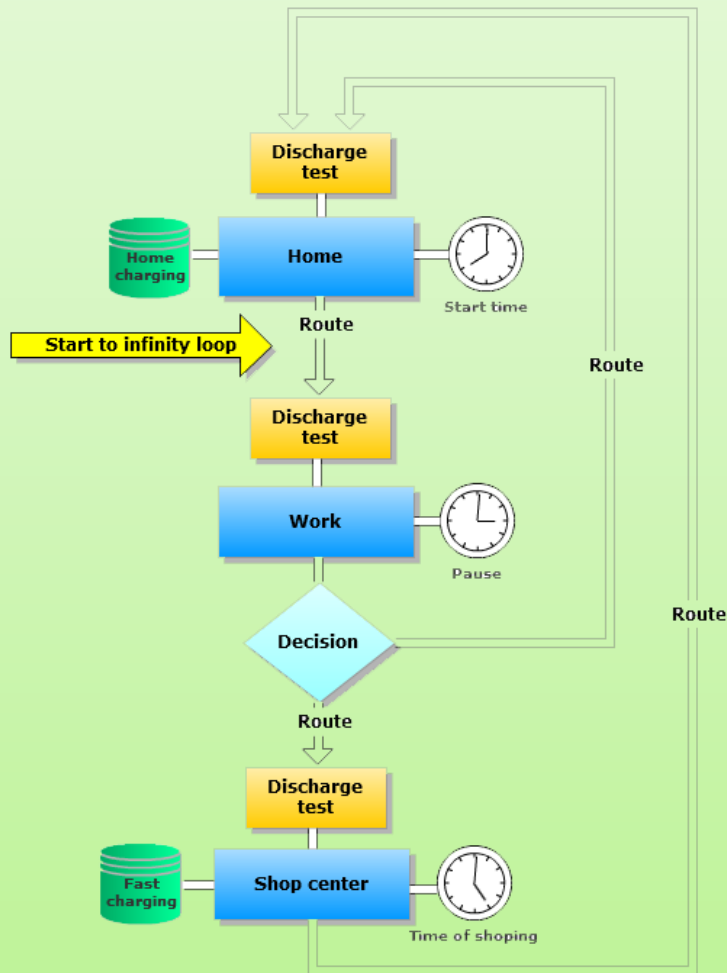

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

# Transaction

## Transaction entities

-  **HomeCharging**
    - current (A)
    - voltage (V)
    - time of morning departure
    - ← charged energy (kWh)
  -  **FastCharging (in shop center)**
    - current (A)
    - voltage (V)
    - time of shopping
    - number of charging station
    - maximal waiting
    - ← charged energy (kWh)
  -  **Work (Pause)**
    - duration
  -  **Route**
    - distance (km)
    - velocity (km/h)
  -  **Discharge test (included in route entity)**
    - limit (minimal threshold)
    - delay
    - ← out of battery event
  -  **Decision**
    - probability of shopping
- 
-  **Actor = E-car**
    - capacity (of battery) (kWh)
    - actual energy
    - energy consumption (kWh/km)
    - out of battery event (within day)

# Submodels

- E-car
  - Battery capacity and fixed consumption per km
- Charging
  - More sophisticated model
  - CC - constant charging current
  - CV - current gradually declines
- Out-of-battery events
  - Energy levels drops below the limit

# Škoda Octavia Green-E-Line

**ETOS**

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

# Batteries specification

- Technology
  - Li-Ion
  - Cylindrical cells
- Electrical parameters
  - Energy 26kWh (324V x 80Ah)
  - Nominal Voltage 324V
  - Discharge Current 400A peak / 200A cont.
  - Capacity 80Ah
- Mechanical parameters
  - Weight 315kg
  - Volume 250l

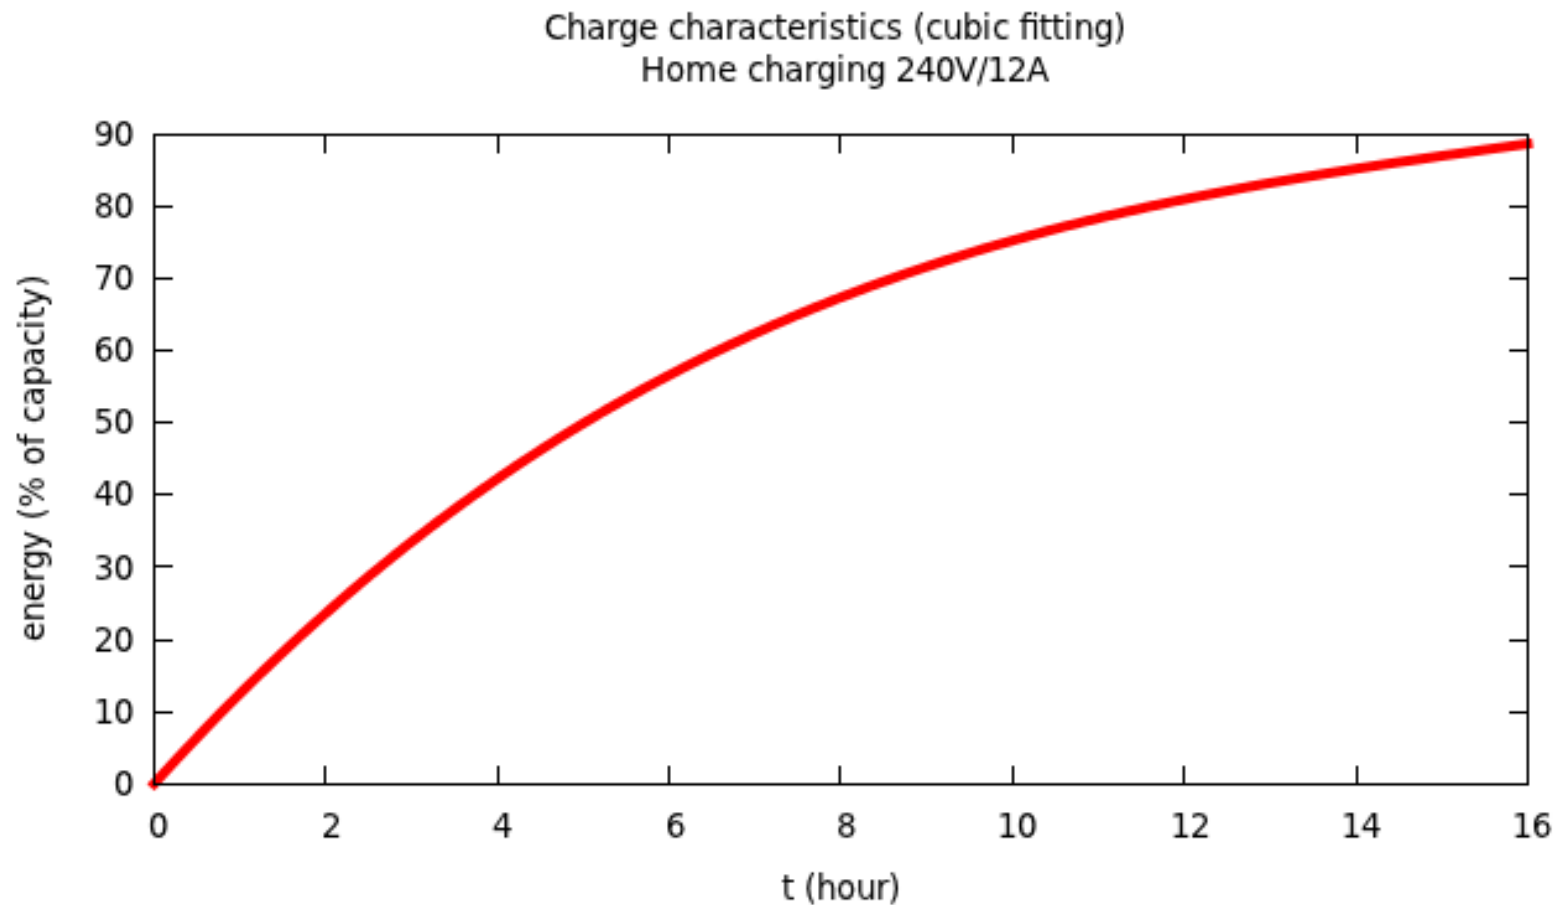

EVENT BASED SIMULATION SYSTEM  
Powered by python3 and SimPy

UNIVERZITA J. E. PURKYNĚ V ÚSTÍ NAD LABEM

# Charge characteristics

**ETOS**

EVENT BASED SIMULATION SYSTEM

# Model parameters

- Fixed parameters
  - Car count = 150
  - Traffic days simulated = 20
  - Simulations count = 500
  - Total e-car\*days = 1 500 000
- Variable parameters
  - Ammount of stations in range of 1 to 50
  - Propability of shopping center visit

# XML model (fragment)

```
<infinity_loop>
  <transaction>
    <set property="a.batteryOutEvent">
      <value>
        0.0
      </value>
    </set>
    <route id="City">
      <distance context="transaction">
        <pnormal mu="20" sigma="5"/>
      </distance>
    </route>
    <pause>
      <duration>
        8:30:00
      </duration>
    </pause>
  </transaction>
</infinity_loop>
```

# Fast to home charging ratio
